An overview of neurotechnology, the engineering of robots based on animals and animal behavior. The goal of neurotechnology is to confer the performance advantages of animal systems on robotic machines. Biomimetic robots differ from traditional robots in that they are agile, relatively cheap, and able to deal with real-world environments. Studies of animal behavior have extended these capabilities to reactive navigation and investigation. The integration of these higher order animal control schemes with biomimetic sensors and actuators may revolutionize robotics.
