

# Download Physics Knight Answer Manual

At every company I have worked at, I have found that people are still writing their SQL queries in the ANSI-89 standard: `select a.id, b.id, b.address_1 from person a, address b where a.id = b.id ...` Security Notice: This solution should not be used in situations where the quality of your randomness can affect the security of an application. In particular, `rand()` and `uniqid()` are not cryptographically secure random number generators. See Scott's answer for a secure alternative.. If you do not need it to be absolutely unique over time: `md5(uniqid(rand(), true))` `unzip` has a nifty option `-j`, whereby the directory structure of the archive is discarded, and all files are extracted into the same directory. Is there a way of making tar work in the same way? No...
